This note is focused on analog electronics with an emphasis on transistor level design of integrated circuits. Topics covered includes: transistor amplifiers, integrated circuit biasing techniques, output stage design and IC amplifier building blocks, frequency response of amplifiers, stability and compensation techniques for amplifiers using negative feedback.

An integrated circuit or monolithic integrated circuit (also referred to as an IC, a chip, or a microchip) is a set of electronic circuits on one small flat piece (or "chip") of semiconductor material, normally silicon. The integration of large numbers of tiny transistors into a small chip results in circuits that are orders of magnitude smaller, cheaper, and faster than those constructed of ...

A spark gap consists of an arrangement of two conducting electrodes separated by a gap usually filled with a gas such as air, designed to allow an electric spark to pass between the conductors. When the potential difference between the conductors exceeds the breakdown voltage of the gas within the gap, a spark forms, ionizing the gas and drastically reducing its electrical resistance.

A zigzag-like design for Li-ion batteries is proposed to simultaneously achieve superior foldability up to 180° and high energy density. A foldable battery thus fabricated demonstrates an energy density of 275 Wh L⁻¹ and is resilient to fatigue over 45 000 dynamic cycles with a folding angle of 130°, while retaining stable electrochemical performance.

All About Contactors. When a relay is used to switch a large amount of electrical power through its contacts, it is designated by a special name: contactor. Contactors typically have multiple contacts, and those contacts are usually (but not always) normally-open, so that power to the load is shut off when the coil is de-energized.
